

dotnet add package Microsoft.AspNetCore.Cors

Add following code in program.cs

```
builder.Services.AddCors(options =>
{
    options.AddPolicy("AllowSpecificOrigin",
        policy => policy.WithOrigins("https://example.com") // Allow this domain
        .AllowAnyHeader()
        .AllowAnyMethod());
});
```

OR

```
builder.Services.AddCors(options =>
{
    options.AddPolicy("AllowCustomPolicy", policy =>
    {
        policy.WithOrigins("https://your-frontend.com") // 👉 Your client app origin
        .WithHeaders("Authorization", "Content-Type", "X-Custom-Header") // 👉 Allow
restricted headers
        .WithMethods("GET", "POST", "PUT", "DELETE", "OPTIONS", "PATCH") // 👉 Allow
non-simple methods
        .AllowCredentials(); // 👉 Only if you're sending cookies or auth tokens
    });
});
```

### Example

```
fetch("https://your-api.com/resource", {  
  method: "DELETE", // or PUT, PATCH, etc.  
  headers: {  
    "Authorization": "Bearer yourToken",  
    "Content-Type": "application/json",  
    "X-Custom-Header": "some-value"  
  },  
  credentials: "include" // Only if using cookies or Authorization  
});
```

```
var app = builder.Build(); // Use CORS in the application  
app.UseCors("AllowSpecificOrigin");
```
